

# Hospitality Analytics Project

## Overview

This project was developed using Informatica Intelligent Cloud Services (IICS) and Oracle Database.

The objective is to process hospitality data, validate records, calculate revenue information, and generate analytics-ready data for reporting.

---

## Source Tables

### Guest Master

Contains guest information.

### Room Master

Contains room details.

### Check-In Check-Out

Contains guest stay transactions.

---

## Target Tables

### STG\_GUEST\_MASTER

Stores guest staging data.

### STG\_ROOM\_MASTER

Stores room staging data.

### FACT\_GUEST\_STAY

Stores final stay and revenue information.

### REJECT\_STAY

Stores invalid records.

---

## Mappings

### 1. m\_Load\_STG\_GUEST\_MASTER

Loads guest data into staging.

Validation:

- AddressLine2 should not be null.

### 2. m\_Load\_STG\_ROOM\_MASTER

Loads room data into staging.

Validation:

- RoomType should not be null.

### 3. m\_Load\_FACT\_GUEST\_STAY

Main business mapping.

Functions:

- Guest Lookup
- Room Lookup
- Revenue Calculation
- Data Validation
- Reject Handling

---

## Main Business Logic

### Revenue Calculation

Final Amount = Room Rate + Extra Charges - Discount Amount

### Occupancy Status

CheckedIn → Occupied

Others → Available

---

## Data Quality

Invalid records are redirected to reject tables using Router transformations.

Examples:

- Missing Guest ID
  - Missing Room ID
  - Invalid Room Rate
  - Missing Checkout Information
-
